

Put to Light instead of Pick by Light at Weltbild publishing group

More efficient goods and branch distribution

Application

In the four commissioning zones at Weltbild, the precommissioned goods from a container delivered by a conveying belt are sorted into customer order-related compartments of a sorting cart.

The sorting carts are located behind racks that are equipped with display modules for visualization of commissioning orders and a bar code reader to scan order lists and articles.

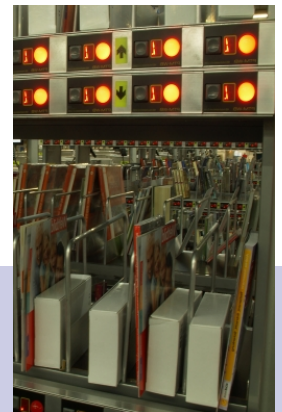

With Put to Light, confusions are ruled out

High flexibility thanks to customized solutions

Instead of equipping several hundreds of commissioning carts with Pick by Light, only 66 immobile sorting racks were specifically manufactured and provided with display modules. Weltbild could thus considerably reduce the cost of investment.

For Weltbild, we also specifically manufactured extremely narrow display modules, which allow the picking of 80 orders into a single cart.

Interview with David Bassl, Weltbild project manager

“With Put-to-Light we have cut by half our order picking error rate that had already been low before.”

“The light-guided method is so secure that we can now do without the full check of each individual order we practiced before.”
