

LED-Pointer

Additional container illumination with spotlight

The LED pointer provides an extended compartment display option for additional container illumination.

Optical Order Picking Aid

The storage or removal compartment can now also be illuminated by a clearly visible LED spotlight. This optical indicator helps the order picker to reach into the right compartment.

The target compartment can be illuminated simultaneously with the eye-catching lamp or by flashing conspicuously or alternately with the eye-catching light.

More safety during order picking

The targeted illumination of the target compartments optimizes visibility and thus accelerates the removal or storage processes.

The pointer module is available in three tilt angles (0°, 22° or 45°), in special cases other tilt angles are possible and can be mounted below (DOWN version) or above the shelf display (UP version).

With few exceptions, the LED pointer option is possible for almost all PTF compartment displays. It thus supplements the classic eye-catching lamp by providing even clearer identification of the removal compartment.

Process optimization

The LED pointer option expands the possibilities for efficient control, acceleration and prevention of picking errors in manual picking processes.

Possible applications

- Particularly suitable for Put-to-Light systems or picking carts.

The benefits at a glance

- Acceleration of removal or storage processes.
- Higher level of safety and prevention of picking errors due to optimized visibility of the target compartments.
- Combined with almost all PTF compartment displays.
