

Single bin illumination with PTF PT-4

PT-4 pointer module is a special design for the targeted indication and illumination of individual, subdivided order picking compartments or positions at low to medium intervention heights.

Useful for goods-to-man order picking

As a pure light module with a single-colour LED light source and fixed light beam positioning, PT-4 is a cost-efficient alternative for picking from multi-subdivided target bins or target compartments / trays.

For this purpose, the module is mounted directly overhead the target compartments by simply clipping it onto the PTF base profile (snap-on technology). The size of the light spot varies depending on the mounting distance to the container. A pick-by-light display is used for quantity indication, confirmation and possible operator guidance.

PT-4 indicates the picker the precise compartment from which goods have to be picked.

Compact pointer module for put and pick applications from storage bins with multiple single bins.

Module details:

Dimensions (W x H x D):

47 x 48 x 19 mm

Case material:

Aluminium

Mounting:

Snap-On technology

Light source:

Monochrome LED
(white or amber)
